	a)	a) Smoke Wind-Tunnel (Nebelwindkanal) A series of smoke wind-tunnels (Nessgerat 40) is being produced. The apparatus consists of a metal tube approximately 100 - 120 cm long which is tapered at one end where there is an air suction device. At the wide end, there is a small electrical spiral element above which there is an oil container which drops oil into the element, producing, according to its consistency, a yellow or blue groke. In the middle of the tube there are the necessary supports for a model under test, and the behavior of the air currents passing over aerofoils can be observed through windows in the tube.								
	b)	"Waltergeräte"								
		A series of sectional aluminum models of jet engines is being built for instructional purposes. The models are approximately 150 cm long and are electrically driven.								t for and are
